Induced Surface Charge on Lysozyme

Electrostatic Potential ϕ

Region II: solvent

Region I: protein

Surface
Γ

$$\nabla^2 \varphi_{\text{protein}}(\mathbf{r}) = -\sum_i \frac{q_i \delta(\mathbf{r} - \mathbf{r}_i)}{\epsilon_0 \epsilon_{\text{protein}}}$$

$$\nabla^2 \varphi_{\text{solvent}}(\mathbf{r}) = 0$$

q_1

$\hat{\mathbf{n}}(\mathbf{r})$

q_2

$\epsilon_{\text{protein}}$

ϵ_{water}

We can write a Boundary Integral Equation (BIE) for the induced surface charge σ,

$$\sigma(\vec{r}) + \hat{\epsilon} \int_{\Gamma} \frac{\partial}{\partial n(\vec{r})} \frac{\sigma(\vec{r}')d^2\vec{r}'}{4\pi||\vec{r} - \vec{r}'||} = -\hat{\epsilon} \sum_{k=1}^{Q} \frac{\partial}{\partial n(\vec{r})} \frac{q_k}{4\pi||\vec{r} - \vec{r}_k||}$$

$$(\mathcal{I} + \hat{\epsilon}\mathcal{D}^*)\,\sigma(\vec{r}) =$$

where we define

$$\hat{\epsilon} = 2\frac{\epsilon_I - \epsilon_{II}}{\epsilon_I + \epsilon_{II}} < 0$$

Outline

Problem

Boundary element discretizations of solvation:

- can be expensive to solve

- are more accurate than required by intermediate design iterations

Outline

1. Approximating the Poisson Operator
   - Approximate Operators
   - Approximate Boundary Conditions

Generalized Born Approximation

The pairwise energy between charges is defined by the *Still equation*:

$$G_{es}^{ij} = \frac{1}{8\pi} \left(\frac{1}{\epsilon_{II}} - \frac{1}{\epsilon_I} \right) \sum_{i,j}^{N} \frac{q_i q_j}{r_{ij}^2 + R_i R_j e^{-r_{ij}^2 / 4R_i R_j}}$$

where the *effective Born radius* is

$$R_i = \frac{1}{8\pi} \left(\frac{1}{\epsilon_{II}} - \frac{1}{\epsilon_I} \right) \frac{1}{E_i}$$

where E_i is the *self-energy* of the charge q_i, the electrostatic energy when atom i has unit charge and all others are neutral.

GB Problems

- No global potential solution, only energy
- No analysis of the error
  - For example, Salsbury 2006 consists of parameter tuning
- No path for systematic improvement
  - For example, Sigalov 2006 changes the model
- The same atoms have different radii in different
  - molecules,
  - solvents
  - temperatures
- LOTS of parameters
  - Nina, Beglov, Roux 1997

GB Problems

- No global potential so
- No analysis of the err
  - For example, Salsbury 200
- No path for systematic
  - For example, Sigalov 2006
- The same atoms have
  - molecules,
  - solvents
  - temperatures
- LOTS of parameters
  - Nina, Beglov, Roux 1997

TABLE 2: Atomic Born Radii Derived from Solvent Electrostatic Charge Distribution Tested with Free Energy Perturbation Methods in an Explicit Solvent[a]

atom	radius (Å)	
	Backbone	
C	2.04	carbonyl C, peptide backbone
O	1.52	carbonyl oxygen
	2.23	peptide nitrogen
CA	2.86	all CA except Gly
CA	2.38	Gly only
	Hydrogens	
H*	0.00	all hydrogens

Bioelectrostatics
Mathematical Model

The *reaction* potential is given by

$$\phi^R(\vec{r}) = \int_\Gamma \frac{\sigma(\vec{r}')d^2\vec{r}'}{4\pi\epsilon_1||\vec{r}-\vec{r}'||} = C\sigma$$

which defines G_{es}, the electrostatic part of the solvation free energy

$$\Delta G_{es} = \frac{1}{2}\left\langle q, \phi^R \right\rangle$$
$$= \frac{1}{2}\left\langle q, Lq \right\rangle$$
$$= \frac{1}{2}\left\langle q, CA^{-1}Bq \right\rangle$$

where

$$Bq = -\hat{\epsilon}\int_\Omega \frac{\partial}{\partial n(\vec{r})}\frac{q(\vec{r}')d^3\vec{r}'}{4\pi||\vec{r}-\vec{r}'||}$$
$$A\sigma = \mathcal{I} + \hat{\epsilon}\mathcal{D}^*$$

BIBEE
Approximate $\mathcal{D}^*$ by a diagonal operator

Boundary Integral-Based Electrostatics Estimation

Coulomb Field Approximation:
uniform normal field

$$\left(1 - \frac{\hat{\epsilon}}{2}\right)\sigma_{CFA} = Bq$$

Lower Bound:
no good physical motivation

$$\left(1 + \frac{\hat{\epsilon}}{2}\right)\sigma_{LB} = Bq$$

Eigenvectors: BEM $e_i \cdot e_j$ BIBEE/P
BIBEE
Approximate $\mathcal{D}^*$ by a diagonal operator

Boundary Integral-Based Electrostatics Estimation

Coulomb Field Approximation:
uniform normal field

$$\left(1 - \frac{\hat{\epsilon}}{2}\right)\sigma_{CFA} = Bq$$

Preconditioning:
consider only local effects

$$\sigma_P = Bq$$

Eigenvectors: BEM $e_i \cdot e_j$ BIBEE/P
BIBEE Bounds on Solvation Energy

Theorem: The electrostatic solvation energy ΔG_{es} has upper and lower bounds given by

$$\frac{1}{2}\left(1 + \frac{\hat{\epsilon}}{2}\right)^{-1}\langle q, CBq\rangle \le \frac{1}{2}\left\langle q, CA^{-1}Bq\right\rangle \le \frac{1}{2}\left(1 - \frac{\hat{\epsilon}}{2}\right)^{-1}\langle q, CBq\rangle,$$

and for spheres and prolate spheroids, we have the improved lower bound,

$$\frac{1}{2}\langle q, CBq\rangle \le \frac{1}{2}\left\langle q, CA^{-1}Bq\right\rangle,$$

and we note that

$$|\hat{\epsilon}| < \frac{1}{2}.$$

Energy Bounds:

Proof: Bardhan, Knepley, Anitescu, JCP, **130**(10), 2008

I will break the proof into three steps,

- Replace C with B
- Symmetrization
- Eigendecomposition

shown in the following slides.

We will need the single layer operator $\mathcal{S}$ for step 1,

$$\mathcal{S}\tau(\vec{r}) = \int \frac{\tau(\vec{r}')d^2\vec{r}'}{4\pi||\vec{r} - \vec{r}'||}$$

Energy Bounds: First Step
Replace C with B

The potential at the boundary Γ given by

$$\phi^{Coulomb}(\vec{r}) = C^T q$$

can also be obtained by solving an exterior Neumann problem for τ,

$$
\begin{aligned}
\phi^{Coulomb}(\vec{r}) &= \mathcal{S}\tau \\
&= \mathcal{S}(\mathcal{I} - 2\mathcal{D}^*)^{-1}(\frac{2}{\hat{\epsilon}}Bq) \\
&= \frac{2}{\hat{\epsilon}}\mathcal{S}(\mathcal{I} - 2\mathcal{D}^*)^{-1}Bq
\end{aligned}
$$

so that the solvation energy is given by

$$\frac{1}{2}\left\langle q, CA^{-1}Bq \right\rangle = \frac{1}{\hat{\epsilon}}\left\langle \mathcal{S}(\mathcal{I} - 2\mathcal{D}^*)^{-1}Bq, (\mathcal{I} + \hat{\epsilon}\mathcal{D}^*)^{-1}Bq \right\rangle$$

Energy Bounds: Second Step
Quasi-Hermiticity

Plemelj's symmetrization principle holds that

$$\mathcal{S}\mathcal{D}^* = \mathcal{D}\mathcal{S}$$

and we have

$$\mathcal{S} = \mathcal{S}^{1/2}\mathcal{S}^{1/2}$$

which means that we can define a Hermitian operator H similar to $\mathcal{D}^*$

$$H = \mathcal{S}^{1/2}\mathcal{D}^*\mathcal{S}^{-1/2}$$

leading to an energy

$$\frac{1}{2}\left\langle q, CA^{-1}Bq \right\rangle = \frac{1}{\hat{\epsilon}}\left\langle Bq, \mathcal{S}^{1/2}(\mathcal{I} - 2H)^{-1}(\mathcal{I} + \hat{\epsilon}H)^{-1}\mathcal{S}^{1/2}Bq \right\rangle$$

Energy Bounds: Third Step
Eigendecomposition

The spectrum of $\mathcal{D}^*$ is in $[-\frac{1}{2}, \frac{1}{2})$, and the energy is

$$\frac{1}{2}\left\langle q, CA^{-1}Bq \right\rangle = \sum_i \frac{1}{\hat{\epsilon}}\left(1 - 2\lambda_i\right)^{-1}\left(1 + \hat{\epsilon}\lambda_i\right)^{-1}x_i^2$$

where

$$H = V\Lambda V^T$$

and

$$\vec{x} = V^T\mathcal{S}^{1/2}Bq$$

Energy Bounds: Diagonal Approximations

The BIBEE approximations yield the following bounds

$$\frac{1}{2} \left\langle q, CA_{CFA}^{-1} Bq \right\rangle = \sum_i \frac{1}{\hat{\epsilon}} \left(1 - 2\lambda_i\right)^{-1} \left(1 - \frac{\hat{\epsilon}}{2}\right)^{-1} x_i^2$$

$$\frac{1}{2} \left\langle q, CA_{P}^{-1} Bq \right\rangle = \sum_i \frac{1}{\hat{\epsilon}} \left(1 - 2\lambda_i\right)^{-1} x_i^2$$

$$\frac{1}{2} \left\langle q, CA_{LB}^{-1} Bq \right\rangle = \sum_i \frac{1}{\hat{\epsilon}} \left(1 - 2\lambda_i\right)^{-1} \left(1 + \frac{\hat{\epsilon}}{2}\right)^{-1} x_i^2$$

where we note that

$$|\hat{\epsilon}| < \frac{1}{2}$$

Outline

1. Approximating the Poisson Operator
   - Approximate Operators
   - Approximate Boundary Conditions

Bioelectrostatics
Physical Model

Electrostatic Potential ϕ

Region II: solvent

Region I: protein

Surface
Γ

$\nabla^2 \varphi_{\text{protein}}(\mathbf{r}) = -\sum_i \dfrac{q_i \delta(\mathbf{r} - \mathbf{r}_i)}{\epsilon_0 \epsilon_{\text{protein}}}$ $\nabla^2 \varphi_{\text{solvent}}(\mathbf{r}) = 0$

q_1

$\epsilon_{\text{protein}}$ $\hat{\mathbf{n}}(\mathbf{r})$

q_2

ϵ_{water}
Kirkwood's Solution (1934)

The potential inside Region I is given by

$$\Phi_I = \sum_{k=1}^{Q} \frac{q_k}{\epsilon_1 \left| \vec{r} - \vec{r}_k \right|} + \psi,$$

and the potential in Region II is given by

$$\Phi_{II} = \sum_{n=0}^{\infty} \sum_{m=-n}^{n} \frac{C_{nm}}{r^{n+1}} P_n^m(\cos\theta) e^{im\phi}.$$

Kirkwood's Solution (1934)

The reaction potential ψ is expanded in a series

$$\psi = \sum_{n=0}^{\infty} \sum_{m=-n}^{n} B_{nm} r^n P_n^m (\cos \theta) e^{im\phi}.$$

and the source distribution is also expanded

$$\sum_{k=1}^{Q} \frac{q_k}{\epsilon_1 \left| \vec{r} - \vec{r}_k \right|} = \sum_{n=0}^{\infty} \sum_{m=-n}^{n} \frac{E_{nm}}{\epsilon_1 r^{n+1}} P_n^m (\cos \theta) e^{im\phi}.$$

Kirkwood's Solution (1934)

By applying the boundary conditions, letting the sphere have radius b,

$$\Phi_I|_{r=b} = \Phi_{II}|_{r=b}$$
$$\epsilon_I \frac{\partial \Phi_I}{\partial r}|_{r=b} = \epsilon_{II} \frac{\partial \Phi_{II}}{\partial r}|_{r=b}$$

we can eliminate C_{nm}, and determine the reaction potential coefficients in terms of the source distribution,

$$B_{nm} = \frac{1}{\epsilon_I b^{2n+1}} \frac{(\epsilon_I - \epsilon_{II})(n+1)}{\epsilon_I n + \epsilon_{II}(n+1)} E_{nm}.$$

Approximate Boundary Conditions

Theorem: The BIBEE boundary integral operator approximations

$$A_{CFA} = \mathcal{I}\left(1 + \frac{\hat{\epsilon}}{2}\right)$$

$$A_P = \mathcal{I}$$

have an equivalent PDE formulation,

$$\epsilon_I \Delta \Phi_{CFA,P} = \sum_{k=1}^{Q} q_k \delta(\vec{r} - \vec{r}_k) \qquad \frac{\epsilon_I}{\epsilon_{II}}\frac{\partial \Phi_I^C}{\partial r}|_{r=b} = \frac{\partial \Phi_{II}}{\partial r} - \frac{\partial \psi_{CFA}}{\partial r}|_{r=b}$$

$$\epsilon_{II}\Delta \Phi_{CFA,P} = 0 \qquad\qquad\qquad \textbf{or}$$

$$\Phi_I|_{r=b} = \Phi_{II}|_{r=b} \qquad \frac{3\epsilon_I - \epsilon_{II}}{\epsilon_I + \epsilon_{II}}\frac{\partial \Phi_I^C}{\partial r}|_{r=b} = \frac{\partial \Phi_{II}}{\partial r} - \frac{\partial \psi_P}{\partial r}|_{r=b},$$

where Φ_1^C is the Coulomb field due to interior charges.

Approximate Boundary Conditions

Theorem: For spherical solute, the BIBEE boundary integral operator approximations have eigenspaces are identical to that of the original operator.
BEM eigenvector $e_i \cdot e_j$ BIBEE/P eigenvector

Proof of PDE Equivalence

Proof: Bardhan and Knepley, JCP, **135**(12), 2011.

In order to show that these PDEs are equivalent to the original BIEs,

- Start with the fundamental solution to Laplace's equation $G(r, r')$

- Note that $\int_\Gamma G(r, r')\sigma(r')d\Gamma$ satisfies the bulk equation and decay at infinity

- Insertion into the approximate BC gives the BIBEE boundary integral approximation

The result does not hold for general boundaries.

Series Solutions

Note that the approximate solutions are *separable*:

$$B_{nm} = \frac{1}{\epsilon_1 n + \epsilon_2 (n+1)} \gamma_{nm}$$

$$B_{nm}^{CFA} = \frac{1}{\epsilon_2} \frac{1}{2n+1} \gamma_{nm}$$

$$B_{nm}^{P} = \frac{1}{\epsilon_1 + \epsilon_2} \frac{1}{n + \frac{1}{2}} \gamma_{nm}.$$

If $\epsilon_I = \epsilon_{II} = \epsilon$, both approximations are exact:

$$B_{nm} = B_{nm}^{CFA} = B_{nm}^{P} = \frac{1}{\epsilon(2n+1)} \gamma_{nm}.$$

Series Solutions

Note that the approximate solutions are *separable*:

$$B_{nm} = \frac{1}{\epsilon_1 n + \epsilon_2(n+1)}\gamma_{nm}$$

$$B_{nm}^{CFA} = \frac{1}{\epsilon_2}\frac{1}{2n+1}\gamma_{nm}$$

$$B_{nm}^{P} = \frac{1}{\epsilon_1 + \epsilon_2}\frac{1}{n+\frac{1}{2}}\gamma_{nm}.$$

If $\epsilon_I = \epsilon_{II} = \epsilon$, both approximations are exact:

$$B_{nm} = B_{nm}^{CFA} = B_{nm}^{P} = \frac{1}{\epsilon(2n+1)}\gamma_{nm}.$$

Asymptotics

BIBEE/CFA is exact for the $n = 0$ mode,

$$B_{00} = B_{00}^{CFA} = \frac{\gamma_{00}}{\epsilon_2},$$

whereas BIBEE/P approaches the exact response in the limit $n \to \infty$:

$$\lim_{n \to \infty} B_{nm} = \lim_{n \to \infty} B_{nm}^P = \frac{1}{(\epsilon_1 + \epsilon_2)n} \gamma_{nm}.$$

Asymptotics

BIBEE/CFA is exact for the $n = 0$ mode,

$$B_{00} = B_{00}^{CFA} = \frac{\gamma_{00}}{\epsilon_2},$$

whereas BIBEE/P approaches the exact response in the limit $n \to \infty$:

$$\lim_{n \to \infty} B_{nm} = \lim_{n \to \infty} B_{nm}^{P} = \frac{1}{(\epsilon_1 + \epsilon_2)n}\gamma_{nm}.$$

Asymptotics

In the limit $\epsilon_1/\epsilon_2 \to 0$,

$$\lim_{\epsilon_1/\epsilon_2 \to 0} B_{nm} = \frac{\gamma_{nm}}{\epsilon_2(n+1)}$$

$$\lim_{\epsilon_1/\epsilon_2 \to 0} B_{nm}^{CFA} = \frac{\gamma_{nm}}{\epsilon_2(2n+1)},$$

$$\lim_{\epsilon_1/\epsilon_2 \to 0} B_{nm}^P = \frac{\gamma_{nm}}{\epsilon_2\left(n+\frac{1}{2}\right)},$$

so that the approximation ratios are given by

$$\frac{B_{nm}^{CFA}}{B_{nm}} = \frac{n+1}{2n+1}, \qquad \frac{B_{nm}^P}{B_{nm}} = \frac{n+1}{n+\frac{1}{2}}.$$

Improved Accuracy

BIBEE/I interpolates between BIBEE/CFA and BIBEE/P
Bardhan, Knepley, JCP, 2011.

Basis Augmentation

We examined the more complex problem of protein-ligand binding using trypsin and bovine pancreatic trypsin inhibitor (BPTI), using *electrostatic component analysis* to identify residue contributions to binding and molecular recognition.
Basis Augmentation

Looking at an ensemble of synthetic proteins, we can see that BIBEE/CFA becomes more accurate as the monopole moment increases, and BIBEE/P more accurate as it decreases. BIBEE/I is accurate for spheres, but must be extended for ellipses.
Basis Augmentation

For ellipses, we add a few low order multipole moments, up to the octopole, to recover 5% accuracy for all synthetic proteins tested.

Resolution

Outline

Origins of Electrostatic Asymmetry
Origins of Electrostatic Asymmetry
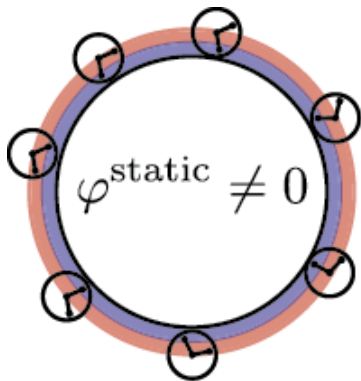

Origins of Electrostatic Asymmetry
Main Idea

Solvation-Layer Interface Condition (SLIC)

Instead of assuming the model and energy
and deriving the radii,

$$\epsilon_I \frac{\partial \Phi_I}{\partial n} = \epsilon_{II} \frac{\partial \Phi_{II}}{\partial n}$$

Solvation

Main Idea

Solvation-Layer Interface Condition (SLIC)

assume the energy and radii and derive the model.

$$(\epsilon_I - \Delta\epsilon h(E_n)) \frac{\partial \Phi_I}{\partial n} = (\epsilon_{II} - \Delta\epsilon h(E_n)) \frac{\partial \Phi_{II}}{\partial n}$$

Main Idea

Solvation-Layer Interface Condition (SLIC)

Using our correspondence with the BIE form,

$$\left(\mathcal{I} + h(E_n) + \hat{\epsilon} \left(-\frac{1}{2}\mathcal{I} + \mathcal{D}^* \right) \right) \sigma = \hat{\epsilon} \sum_{k=1}^{Q} \frac{\partial G}{\partial n}$$

where h is a diagonal nonlinear integral operator.

SLIC
Boundary Perturbation

$$h(E_n) = \alpha \tanh\left(\beta E_n - \gamma\right) + \mu$$

where

α Size of the asymmetry

β Width of the transition region

γ The transition field strength

μ Assures $h(0) = 0$, so $\mu = -\alpha \tanh(-\gamma)$

MeOH	Rb$^+$	-326(-319)	-178 (-175)	55
	F$^-$	-415	-116	-79 (-131)
EtOH	Rb$^+$	-319 (-313)	-197 (-187)	128
	F$^-$	-405	-145	-153 (-194)
F	Rb$^+$	-340 (-334)	-135 (-130)	27
	F$^-$	-418	-128	36 (28)
AN	F$^-$	-390	-192	147
DMF	F$^-$	-389	-230	105
DMSO	Rb$^+$	-348 (-339)	-151 (-180)	32
	F$^-$	-400	-160	186(60)
NM	Rb$^+$	-324 (-318)	-186 (-183)	19
	F$^-$	-391	-182	95(71)
PC	F$^-$	-394	-149	67

Experimental Data in Parentheses

Thermodynamic Predictions
Courtesy A. Molvai Tabrizi

A. Molavi Tabrizi, S. Goossens, M.G. Knepley, and
J.P. Bardhan,
Predicting solvation thermodynamics with dielectric continuum theory and a solvation-layer interface condition (SLIC).
Submitted to Journal of Physical Chemistry Letters
(2016).

Where does SLIC fail?

- Large packing fraction
  - No charge oscillation or overcharging
  - Could use CDFT
- No dielectric saturation
  - Could be possible with different function
- No long range correlations
  - Use nonlocal dielectric

Future Work

- More complex solutes

- Mixtures

- Integration into community code
  - Psi4, QChem, APBS

- Integrate into conformational search
  - Kavrakis Lab at Rice

Thank You!
